Bio-Fungi-Coloring-Answers Flashcards | Quizlet

A fungi spore is a haploid cell produced by mitosis from a haploid parent cell. It is genetically identical to the parent cell. Fungi spores can develop into new haploid individuals without being fertilized. Spores may be dispersed by moving water, wind, or other organisms.

Fungus worksheet KEY.docx - Introduction to Fungi Lesson

...

Fungi are eukaryotic, non-vascular, non-motile and heterotrophic organisms. They may be unicellular or filamentous. They reproduce by means of spores. Fungi exhibit the phenomenon of alternation of generation. Fungi lack chlorophyll and hence cannot perform photosynthesis. Fungi store their food in the form of starch.

Fungi | Microbiology - Lumen Learning

Fungi (singular: fungus) are a kingdom of usually multicellular eukaryotic organisms that are heterotrophs (cannot make their own food) and have important roles in nutrient cycling in an ecosystem. Fungi reproduce both sexually and asexually, and they also have symbiotic associations with plants and bacteria. However, they are also responsible for some diseases in plants and animals.
