The typical structural elements in a wood-framed building system are described below. Rafters (Figure 1.3): These are usually sloped sawn-dimension lumber roof beams spaced at fairly close intervals (e.g., 12, 16, or 24 in.) and carry lighter loads than those carried by the roof trusses, beams, or girders.

community completed the development of a load and resistance factor design (LRFD) specification for wood construction. The NDS is based on what is termed allowable stress design (ASD), wherein allowable stresses of a material are compared to calculated working stresses resulting from service loads.
